Experience Certificate

This is to certify that **Vibhisha Vaghasia** was working with Gujarat Biotechnology Research Centre, Department of Science and Technology, Govt. of Gujarat, as a **Senior Research Fellow (SRF)** in the project **"Development of DNA based Diagnostic Kit, Universal Vaccine Candidates for Leptospirosis".**

Vibhisha Vaghasia joined as a Junior Research Fellow (JRF) in the project **"*In-silico* analysis (Proteomics) of effect of genetic variation on the protein structures and potential molecule screening for important diseases"** at Gujarat State Biotechnology Mission (GSBTM) on 24th October 2016. Since Government of Gujarat established **Gujarat Biotechnology Research Centre (GBRC),** Department of Science & Technology, Government of Gujarat, Gandhinagar, on 1st September 2017 as a separate institute to carry out its research activities, Subsequently, **Vibhisha Vaghasia** continued to work as Junior Research Fellow from 1st September 2017 to 23rd October 2018 and was upgraded to **Senior Research Fellow** from 24th October 2018 till 4th November 2019 in the project, "**Development of DNA based Diagnostic Kit, Universal Vaccine candidates for Leptospirosis."**

While conducting research during the aforementioned period, she has contributed significantly to the projects and used various molecular biology techniques and bioinformatics tools for analysis. She is well trained in molecular biology techniques such as DNA isolation, PCR, Gel electrophoresis, Sanger sequencing, Whole Genome Sequencing, Bioanalyzer, Immunodiffusion assay, and handling and maintaining of *Leptospira* culture. She is also skilled in different Bioinformatics pipelines for analysis of Next Generation Sequencing data like Whole Genome Sequencing, Transcriptomics, Metagenomics analysis and Protein Structure Modelling, Molecular Dynamics Simulation and Epitope Analysis. She was involved in Bioinformatics training and workshop on NGS data analysis and proteomics in different university's as well as in organizational development activities. She has also worked on database development, R based data analysis and customization of scripts (Perl) based on study need. During her tenure she has published three research articles in high reputed international journals.

Vibhisha Vaghasia is very sincere, highly committed and dedicated employee having excellent analytical skills. She is trustworthy, courteous, knowledgeable and is able to multi-task can work independently and as a team. She is also an ardent learner which is necessary for acquiring dexterity in carrying out experiments and analysis. I am sure she will be a valuable asset for any organization. I am confident that she will prove herself in research field and wish her success for her future endeavours. We have no objection if she joins any organization.

Gandhinagar team takes initial steps to develop a vaccine for leptospirosis

Currently there is no preventive vaccine for humans that is available in the market

ASWATHI PACHA

A key peptide that can be used to develop a new preventive vaccine against leptospirosis has been successfully identified by researchers from the Gujarat Biotechnology Research Centre, Gandhinagar. Leptospirosis is an emerging tropical infectious disease, and currently there is no preventive vaccine for humans that is available in the market. The researchers used computer-based analysis to study the whole protein set of the bacteria *Leptospira interrogans* and narrowed the search down to one effective immunogenic protein. This protein was found to be present in almost all the serovars (different types within a species) of the bacteria and can be an effective vaccine candidate against most serovars.

Key link: We identified peptide sequences that could bind to our vaccine for long-lasting immune response, explains Jayashankar Das (centre)

Major killer

According to a paper published in 2015, leptospirosis causes almost 60,000 deaths every year, globally. The bacteria can be transmitted via exposure to contaminated water or soil or direct contact with reservoirs hosts like wild or domestic animals.

The proteome (entire protein set) of a serovar Copenhageni strain was studied using bioinformatics (computational biology analysis) approach. "We looked at all the 3,654 proteins in the bacteria with the help of several advanced computational methods and predicted the antigenicity – ability to bind to the antibody present on B cells for inducing immune response," explains Swapnil Kumar, a Junior Research Fellow at the centre and an author of the paper published recently in *Scientific Reports*. "Extensive analysis helped us narrow down to 21 proteins which had high antigenicity score."

Membrane proteins

Among these proteins, the researchers further searched to identify the outer membrane proteins as these are known to play important roles in the interaction between the bacteria and their host. Further computational modelling and simulation helped the researchers narrow it to one specific protein. The protein was chosen as the candidate immunogen once the physicochemical and structural studies were carried out.

The researchers then looked for sites on human T cells and B cells where the antigen could bind. Identification of target sites is a key step in vaccine design. "We looked at the surface of the cells, their flexibility, affinity to water and identified regions or peptide sequences that could bind to our peptide vaccine and give a long lasting immune response," explains Dr. Jayashankar Das, the corresponding author of the paper.

"We have to carry out proteomic and genomic study for different strains of the bacteria followed by *in vitro* validation of the identified key proteins," he adds. The group is also working on high throughput genomic analysis for the development of an on-site diagnostic kit.
